ABSTRACT

We collected drosophilid flies from 2011 to 2012 in Ehime prefecture, Japan and summarized our and the previous records. In the present study, 82 species of the drosophilid flies were recorded in our collection, and 19 species belonging to 9 genera of them were newly recorded in Shikoku. The new records were comprised of the species of *Stegana*, *Leucophenga*, *Paraleucophenga*, *Dichaetophora*, *Mycodrosophila*, *Phorticella*, *Chymomyza*, *Hirtodrosophila* and *Lordiphosa*. As a result, a total of 101 species belonging to 20 genera of the Drosophilidae were recorded from the present and previous surveys in Ehime prefecture.

Key words: the Drosophilidae, faunal survey, new records, Shikoku

Drosophilid fauna of Japan is better known compared with other regions of the world. The extensive survey of drosophilid flies throughout Japan was made by Kikkawa and Peng (1938) followed by Okada (1956), Wakahama (1964), Takada (1971) and Moriwaki (1979). Okada (1988) summarized collection data of the previous surveys including his own records. The number of drosophilid flies was 256 species belonging to 25 genera in Japan. Since 1988, several researchers recorded 60 species of drosophilid flies including 32 of the newly described species in Japan. Finally, a total of 312 species of the Drosophilidae were recorded from Japan (Toda, 2012). However, surveys of drosophilid flies were made intensively in the limited areas. The extensively surveyed areas are Hokkaido, central part of Japan (e.g., Tokyo) and subtropical islands (Kume-jima, Iriomote-jima and the Ogasawara Islands). Hokkaido is one of the most explored area in which 120 species of drosophilid flies

were recorded by Okada (1988) and additional 29 species were recorded by several studies (Toda, 2012). Beppu (2000, 2005, 2006) has made the faunal and ecological surveys of drosophilid flies in Tokyo, and a total of 100 species were collected in these studies. As a result, 138 species were recorded from Tokyo (Okada, 1988; Mitsui, 1973; Beppu, 2006). In Ryukyu Islands, a total of 107 species were collected from Kume-jima and Iriomote-jima (Okada, 1965; Hirai et al., 2000; Kondo and Kimura, 2008). Watada et al. (2011) discussed the temporal change of drosophilid fauna in Ogasawara Islands based on the previous and their own collection data. They reported 26 species including seven endemic species in the Ogasawara Islands. As a result, a total 117 species of drosophilid flies were recorded in the subtropical islands of Japan (Toda, 2012).

Only few information of the drosophilid fauna has been known from the western mainland of Japan (Chugoku, Shikoku and Kyushu). In Ehime prefecture, a few surveys on

2013年1月11日 受理

drosophilid flies had been made mainly by banana trap collection (Moriwaki, 1979). The distribution records from Okada (1988) showed 53 species belonging to 10 genera of drosophilid species were from Ehime prefecture. However, the records gave no information of collection methods, dates and localities in the prefecture. Watada et al. (2000) surveyed abundance of *Drosophila albomicans* and drosophilid fauna by banana bait traps in 21 localities in Ehime prefecture. In the study, 20 species of flies belonging to genus *Drosophila* and *Scaptodrosophila* were recorded. Hoshina and Watada (2001) collected 24 species belonging to *Drosophila*, *Scaptodrosophila* and *Styloptera* by banana traps in five localities in Ehime. By net sweeping collections, Katoh and Watada (2011) studied drosophilid fauna at two localities (Mt. Mikiji and Dogo Park) in Matsuyama, and recorded large numbers of species and genera (a total 52 species belonging to 15 genera including two new species). The previous studies have recorded 75 species belonging to 16 genera in Ehime. In the present study, we recorded additional 21 species and three genera of drosophilid flies in Ehime prefecture.

Fly collection was made by net sweeping and banana bait traps at various localities in Ehime prefecture. The trap collections were made by the "retainer" type traps (Toda, 1977). Fermented bananas by dry yeast were used for the traps. The monthly collection was made by both net sweeping and bait trapping in Matsuyama (Mt. Mikiji and Dogo Park) from April 2011 to April 2012. The occasional net sweeping was made in Komenono experimental forest of Ehime university, Matsuyama on September 2009, and Nametoko in Uwajima on October 2010 and 2012. The present and three previous studies provided the information of collection data, so we reported collection localities and methods for all species recorded in Ehime prefecture. Collection localities are shown in Figure 1.

A total of 82 species belonging to 19 genera were recorded

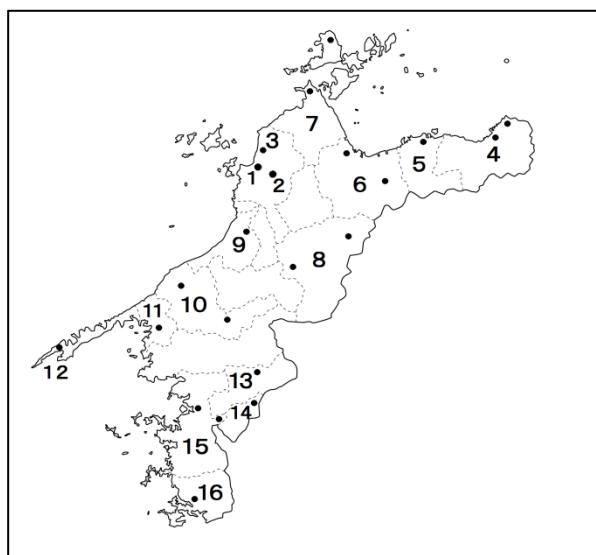

Figure 1. Geographical distribution of collection localities in Ehime prefecture.

Numbered localities correspond to follows: **1** Mt. Mikiji, **2** Dogo Park, **3** Matsuyama (except Mt. Mikiji and Dogo Park), **4** Shikoku-chuo, **5** Niihama, **6** Saijo, **7** Imabari, **8** Kumakogen, **9** Iyo, **10** Ozu, **11** Yawatahama, **12** Ikata, **13** Kihoku, **14** Matsuno, **15** Uwajima, **16** Ainan.

in the present study. The following 19 species belonging to nine genera were newly recorded from Shikoku: *Stegana kanmiyai*, *S. nigrithorax*, *Phortica kappa*, *P. takadai*, *Leucophenga lacteusa*, *L. quadripunctata*, *L. quinquemaculipennis*, *Paraleucophenga argentosa*, *Dichaetophora sakagamii*, *Mycodrosophila basalis*, *My. erecta*, *Phorticella htunmaungi*, *Chymomyza obscuroides*, *Hirtodrosophila fascipennis*, *H. ikedai*, *H. macromaculata*, *H. nokogiri*, *H. pseudonokogiri* and *Lordiphosa collinella*. The species of the genera *Paraleucophenga*, *Phorticella* and *Chymomyza* were recorded in Shikoku for the first time. The two undescribed species, *Phortica* sp. aff. *glabra* and *Scaptodrosophila* sp., recorded by Katoh and Watada (2011) were also collected. Combining these results with the previous studies, 101 species belonging to 20 genera in two subfamilies of the Drosophilidae were recorded in Ehime prefecture (Table 1). The localities with the information of collection methods (**T**, collected by banana traps; **S**, collected by net sweeping) are

shown in the following list.

A list of drosophilid flies with collection localities and methods in Ehime

Stegana kanmiyai Okada et Sidorenko, 1992,

Acknowledgements

We would like to express our sincere thanks to Dr. Masanori J. Toda (Hokkaido University) for the identification of drosophilid flies. We also thank Dr. Yasunori Murakami and Dr. Makiko Fukui for their insightful comments on the manuscript.
